                                                                                                                                             55kD receptor was isolated as an EcoRI fragment encoding 374 amino acids, and cloned into a mammalian cell expression vector, resulting in prinkr. A derivative of the TNF-alpha receptor was produced by domain. PCR with primaris AAQ29237,8 generated a 300pp restriction fragment which was cloned into prinkr, giving prinkecd. DNA sequencing confirmed this contained the designed DNA sequence. The TNF-alpha receptor expression plasmids were then transfected into monkey COS-7 cells.

                                                                                                                                                                                                                                                                                                                               AspSerValCysProGlnGlyLysTyrIleHisProGlnAsnAsnSerIleCysCysThr
                                                                                                                                                                                                                                                                                                                                                                     LysCysHisLysGlyThrTyrLeuTyrAsnAspCysProGlyProGlyGlnAspThrAsp
                                                               The sequence encodes the entire 30 kD TNF inhibitor. The clone from which the sequence was obtd. was isolated from a CDNA library prepd. from 937 cells treated with PMA/PHA. The whole gene can be inserted into expression vectors for prepn. of TNF inhibitor for use in the treatment of inflammatory and degenerative
                    suppression of TNF-alpha
                                                                                                                                                                    2088

ģ Novel 30 kDa tumor necrosis factor inhibitor analog comprising a non-native cysteine residue cross-linked with polyethylene glycol, useful for treating inflammatory and degenerative diseases mediated

Example 6; Fig 21; 82pp; English.

The present invention relates to Tumour Necrosis Factor (TNF) inhibitors (see AAB37676 and AAB37685), which have TNF inhibitory activity. The novel TNF inhibitors of the present invention are useful as therapeutic for treating inflammatory and degenerative diseases mediated by TNF. The present sequence is the coding sequence for the precursor of 30 kDa TNF inhibitor. The 30 kDa TNF inhibitor can inhibit TNF alpha.

                                                                                                                                                                                                                                                                                                   This invention describes novel homogeneous insoluble proteins (I), their (in)soluble fragments (Ia) and their salts that can bind tumour necrosis factor (TNF). The products of the invention have anti-inflammatory and antimalarial activity. (I) and (Ia) are used (i) to treat diseases in which TNF is involved (e.g. septic shock, autoimmune glomerulonephritis, cerebral malaria, immune responses and inflammation), (Ii) to purify TNF (ant)agonists and (IV) for diagnostic determination of TNF in body fluids. Antibodies raised against (I) are used for affinity purification of (I). This sequence encodes a tumour necrosis factor binding protein described in the method of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 366

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  This invention describes novel insoluble proteins (1), also their (in) soluble fragments and pharmaceutically acceptable salts, able to bind tumor necrosis factor (TME) and in homogeneous form. The products of the invention have antiinflammatory, immunosuppressive, antibacterial, to treat diseases mediated by TNF, e.g. shock in cases of meningococcal retact development of autroimmune glomerulonephritis and cerebral malaria. Also (1), or antibodies specific for them, are used for adagnostic determination of TNF in body fluids, for affinity purification of TNF and for identifying (ant) agonists of TNF. This sequence encodes a human TNF binding protein described in the method of the invention.
                                                                                 TNF; tumor necrosis factor binding protein; TNFBP; treatment; insoluble protein; antiinflammatory; immunosuppressive; antibacterial; antiprotozoal; treatment; meningococcal sepsis; cerebral malaria; autoimmune glomerulonephritis; ds.
                                                                                                                                                                                                                                                                                                                                                                                                                                     New homogeneous, insoluble proteins that bind tumor necrosis factor (TNF), useful for treating TNF-mediated disorders, e.g. inflammation
                                                                                                                                                                                                                                                                                                                                                                                       Loetscher

        The invention relates to detecting (MI) granulocyte (GC) activation (GCA), by detecting the level of expression of gene(s) (Gs) identified by DNA chip analysis as given in the specification, and comparing the expression level to an expression level in an unactivated GC, where differential expression of Gs is indicative of GCA. Also included are modulating (M2) GA by contacting GC with an agent that alters the expression of at least one gene in Gs; (2) screening (M3) for an agent capable of modulating GCA or an inflammation (especially chronic) in a tissue, an allergic response in a subject, exposure of a subject to a pathogen or sterile inflammatory disease using the

gene expression profile; (3) detecting (M4) an inflammation (especially chronic) in a tissue, an allergic response in a subject, exposure of a subject to a pathogen or sterile inflammatory disease, by detecting the level of expression in a sample of the minature of inflammation; where the level of expression of the gene is indicative of inflammation; where the level of expression of the gene is indicative of inflammation; where the level of expression of subject, exposure of a subject to a pathogen or sterile inflammation disease, by contacting a tissue having on sterile inflammation with an agent that modulates the expression of gene(s) from Gs in the tissue. M1 is useful for detecting GCA, M2 is useful for from Gs in the tissue. M1 is useful for detecting an inflammation in a tissue; M4 is useful for detecting an inflammation of especially chronic) in a tissue, an allergic response in a subject, exposure of a subject to a pathogen or sterile inflammatory disease (e.g. psporiasis, rheumatoid arthritis, asthma, thrombosis, cardiac reperfusion injury, ARDS, adult respiratory distress syndrome, inflammatory bowel disease, Crohn's disease, ulcerative collitis, ception injury, ARDS, adult respiratory distress syndrome, inflammatory bowel disease, Crohn's disease, ulcerative collitis, ception injury, ARDS, adult respiratory distress syndrome, inflammatory bowel disease, crohn's disease, ulcerative collitis, ception of the above conditions. The present sequence atta for this patent did not form part of ormat directly from WIPO at Commat directlon, but was obtained in electronic format directly from WIPO at
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   120
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        546

The invention relates to a novel method for diagnosing and detecting the progression of liver cancer, hepatocellular carcinoma or metastatic liver tumour in a patient, and differentiating metastatic liver cancer from hepatocellular carcinoma in a patient, involving detecting the level of expression of two or more genes represented in ANB3563-ANB37455 in a cissue sample. The method of the invention has hepatotropic, and cytostatic activity. The method is useful for diagnosing and detecting the progression of liver cancer, hepatocellular carcinoma and metastatic expression profiles which serve as useful diagnostic markers as well as markers that can be used to monitor disease states, disease progression, of markers that can be used to monitor disease states, disease progression, over the sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    GlylleTyrProSerGlyVallleGlyLeuValProHisLeuGlyAspArgGluLysArg

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           495
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        The invention provides antisense compounds targeted to human tumour necrosis factor receptor type 1 (TNFR1) RNA. These antisense compounds can be used in a method of inhibiting the expression of TNFR1 human cells or tissues. The antisense compounds specifically hybridize with one or acid molecules encoding TNFR1 modulating the function of nucleic acid molecules encoding TNFR1, ultimately modulating the amount of TNFR1 produced. The antisense compounds and method are useful as research reagents and diagnostics, and in the treatment and prophylaxis of infection, inflammation or tumour formation. The present sequence represents the nucleotide sequence of human TNFR1 (Genbank Accn No:

This invention relates to a novel method for enhanced killing of tumour cells comprising contacting a tumour cell with a synergistic cells comprising contacting a tumour cell with a synergistic combination of a death domain receptor ligand and a diterpenoid triepoxide. This method has cytostatic activity and works by blocking in the state of the combination may be used for treating tumours, particularly solid tumours, c. invention may be used for treating tumours, particularly solid tumours, also neurological malignancies, particularly solid tumours, also neurological malignancies, non-We cutaneous T-cells, mycosis fungoides, non-We cutaneous T-cells imphoration of papulosis, T-cell rich cutaneous Imphoid hyperplasia, c. lymphomatoid papulosis, T-cell rich cutaneous Imphoid hyperplasia, bullous pemphigoid, discoid lupus erythematosus, lichen planus. The combination may be administered with other active agents, e.g. anti-centered the diterpenoids and the death domain ligands allows increased the testing at equivalent or anti-angiogenic agents. The potent synergy combination and the death domain ligands allows increased resistant cells. This sequence represents the human tumour necrosis factor alpha receptor (TNF-RI) DNA. TNF-RI is a death domain receptor trienancy and the inventor and the papers.
                                                                                                                                                                    diterpenoid trisposide; cytostatic activity; c-IAPJ; c-IAPJ; c-Cardinoms, mammary adenocarcinoms, non-small cell lung carcinoms, neurological malignancy; lichoen planus; non-Bodgkin's lymphoma; chronic lymphocytic leukaemia; anti-angiogenic; malignant cutaneous T-cell; lymphomatoid papulosis; anti-metastatic; non-NF cutaneous T-cell; lymphoma, mycosis fungoides; anti-tumour; T-cell rich cutaneous lymphoid hyperplasia; bullous pemphigoid; discoid lupus erythematosus; human; gene; receptor; TNF-RI.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Use of a synergistic combination of death domain receptor ligands and diterpenoid triepoxides for killing of tumour cells
                                                                                                                                                        ds; tumour; death domain receptor 11gand;

Expression of this receptor is regulated by shedding of the extracellular receptor fragment. The p55 TNF-R can be shed in response to different inducing agents, e.g. phorbol myrisate acetate (PNA), depending on cell type. The only region of the receptor whose structure affects the shedding response is the spacer region (see AAR75012) in the extracellular domain. This region is located close to a site of cleavage of the molecule, and links the Cys rich module to the transmembrane domain. The spacer region of the encoded protein was used to create the chimeras between human p55 TMF-R and murine epidermal growth factor receptor (EGF-R) that are represented by AAR7507-11. This spacer region vas subjected to deletion mutations (AAR7507-11. This spacer region receptor (EGF-R) that are represented by AAR7507-11. This spacer region was subjected to deletion mutations (AAR75013-25) and substitutions can fade chain identity of these residues, with the exceptor of a limited dependence on the identity of Val 173. Mutations which alter the conformation of the protein adversely effect the shedding process. The mutations shown in AAR75013-47 were introduced in order to create an inhibitor of a protease that is capable of cleaving the soluble TMF-R. This conformation of the cell bound TMF-R. Fragments of these inhibitors can be seen in the inhibitors can be seen in the inhibitors.

                                                                                                                                                                                                                   Partial amino acid sequences were determined for the 55 and 75kD TNF-BPs (see AAR11072-R11081) and oligonucleotide primers were synthesised based on these partial sequences. The primers were used to produce a cDNA fragment for use as aprobe to screen a human placental cDNA bank constructed in lambda gill. Positive clones were identified and sequenced. DNA constructs comprising the TNF-BP coding sequence may also contain a fragment encoding a human Ig domain. Recombinant constructs are used to transform cells to confer limproved TNF-binding properties.
                                                                                                                                                        Insoluble tumour necrosis factor binding proteins - and DNA encoding them, useful in pharmaceutical prods. and for antibody prodn.

                                                                                                                                                                                                                                                                                                                                                                        Modification of the tumour necrosis factor receptor by mutation or deletion modulates signal transduction and/or cleavage effected by the receptor. This modulation of activity can also be achieved using effector proteins which interact with the TNF receptor or the effector Molecules which interact with the TNF receptor or the effector proteins can be used to treat or prevent diseases associated with TNF activity e.g. autoimmune disease; rheumatoid arthritis; graft rejection; graft vs. Nost disease or septic shock. They can also be used to treat overdoses of exogenous TNF.
                                                                                                                                                                                                                                                                                                       Modulating activity of tumour necrosis factor receptor - using peptide(s), antibodies, etc. which interact with critical regions of receptor or effector protein, for controlling auto-immune disease, septic shock, etc.
                                                                                                                                  necrosis factor receptor
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           2170

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

                                                                                                                                                                                                                                                                                                                                                     The Inker may comprise 5-100 amino acids selected from Gly, Asp, Ser, Thr and Ala. These linkers separate the individual moeities by such a distance that each component of the fusion protien is capable of folding into the secondary or tertiary structure required for its biological activity. These fusion proteins may be used in therapy, diagnosis and assays for conditions mediated by TNF or IL-1, particularly in conditions in which both TNF and IL-1 play a causitive role. They may be used to treat cachexia, rheumatoid arthritis, diabetes, multiple sclerosis, pulmonary fibrosis and silicosis, cerebral malaria, allograft and xenograft rejection in graft verses host disease, sepsis, septic shock, inflammation, allergies and

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          480
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       720
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     The present invention relates to polymorphic variants of the tumour necrosis factor receptor 1 (TNFR1) gene. The present sequence is the coding sequence of the TNFR1 gene. The sequence of the whole gene is given in AAA5102, AAA5103 and AAA95104. The polymorphisms were identified by amplifying and sequencing regions of the gene. Twelve polymorphic loci were discovered. Of these twelve polymorphisms was ouseful for studying the Drotein. The TWFR1 polymorphisms may be identified for studying the biological function of TWFR1 as well as for identifying drugg targeting the protein for treatment of disorders apoptosis related to its abnormal expression or function such as tumours,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            241 TGCAGGGAGTGTGAGAGGGGTCCTTCACCGCTTCAGAAAACCACCTCAGACACCTCTC

                                                                                             The present invention relates to Tumour Necrosis Factor (TNF) inhibitors dee AAB37676 and AAB37685), which have Thr Inhibitory activity. The novel TNF inhibitors of the present invention are useful as therapeutic agents for inhibiting the activity of TNF and interleukin (IL-1), and for treating inflammatory and degenerative diseases mediated by TNF. The present sequence is the coding sequence for the precursor of 30 kDa TNF inhibitor can inhibit TNF alpha.

This invention describes novel homogeneous insoluble proteins (I), their (in)soluble fragments (Ia) and their salts that can bind tumour necrosis factor (TNF). The products of the invention have anti-inflammatory and antimalarial activity. (I) and (Ia) are used (i) to treat diseases in which TNF is involved (e.g. septic shock, autoimmune glomerulonephritis, cerebral malaria, immune responses and inflammation), (ii) to purify TNF, (iii) to identify TNF (ant)sponists and (iv) for diagnostic determination of TNF in body TNF inlds sequence encodes (I) are used for affinity purification of (I). This sequence encodes a tumour necrosis factor binding protein described in the method of

(in)soluble fragments and pharmaceutically acceptable salts, able to bind tumor necrosis factor (TMF) and in homogeneous form. The products of the invention have antinflammatory, immunosuppressive, antibacterial, antiprotozoal activity. (I), and related recombinant proteins, are used antiprotozoal activity. (I), and related recombinant proteins, are used to treat diseases mediated by TMF. e.g. shock in cases of meningococcal sepsis; development of autoimmune glomerulonephritis and cerebral malaria. Also (I), or antibodies specific for them, are used for diagnostic determination of TMF in body fluids, for affinity purification of TMF and for identifying (anniagonists of TMF. This sequence encodes a human TMF binding protein described in the method of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  120

```
Detecting granulocyte activation by detecting differential expression of genes associated with granulocyte activation, which serves as diagnostic markers that is useful for monitoring disease states and drug toxicity.
                                                                                                     Human; 88; granulocytic cell; DNA chip; bacterial infection, viral infection; parasitic infection; protozoal infection; fungal infection; sterile inflammatory disease; psoriasis; rheumatoid arthritis; glomerulonephritis; asthma; thrombosis; cardiac reperfusion injury; renal reperfusion injury; ARDS; adult respiratory distress syndrome; inflammatory bowel disease; Crohn's disease; ulcerative colitis; periodontal disease; granulocyte activation; chronic inflammation; allergy.
                                                                                   Human cDNA differentially expressed in granulocytic cells #610.
                                                                                                                                                                                                                                                                                                                                  ņ
                                                                                                                                                                                                                                                                                                                                  Yamaga S, Vockley

Claim 1; SEQ ID No 610; 114pp; English.

The invention relates to detecting (MI) granulocyte (GC) activation CC (GCA), by detecting the level of expression of gene(s) (Gs) identified by CC (GCA), by detecting the level of expression of gene(s) (Gs) identified by CC CC MA chip analysis as given in the specification, and comparing the expression level to an expression level in an unactivated CC the control of a control of GCA.

Also included are modulating (MX) GA by contacting GCA with an agent that alters the expression of at least one gene in Gs; (2) screening (MX) for an agent capable of modulating GCA or an inflammation (especially CC chronic) in a tissue, an altergic response in a subject, exposure of a subject to a pathogen or sterile inflammatory disease using the chronic) in a tissue, an altergic response in a subject, exposure of a subject to a pathogen or sterile inflammatory disease, by detecting the level of expression of the gene is indicative of inflammation; where CC the level of expression of the gene is indicative of inflammation; (4) treating (MS) an inflammation (especially chronic) or in a tissue, an allergic response in a subject, exposure of a subject to a pathogen or sterile inflammation (especially chronic) or in a tissue, or sterile inflammation with an agent that modulates the expression of gene(s) from GS in the tissue. MI is useful for detecting at issue having condulating GA mislammation in a tissue, an allergic effecting an inflammation in a tissue, while susful for screening an agent capable of modulating condulating GA preferably in an inflammation in a tissue, an allergic effecting an inflammation of especially chronic) in a tissue, an allergic effecting an inflammation of especially chronic) in a tissue, an allergic effecting an inflammation of especially chronic) in a tissue, an allergic effecting an inflammation of especially chronic) in a tissue, an allergic effecting an inflammation of especially chronic) in a tissue, an allergic effecting an inflammation of especially chronic) in a tissue, an allergic effecting an inflammatory disease (e.g. psoriasis, rheumatoid arthritis, gonerulonephritis, asthma, thrombosis, cardiac reperfusion injury, renal reperfusion injury, ARDS, adult respiratory distress syndrome, inflammatory bowel disease, crohn's disease, ulcerative colitis, periodontal disease; also bacterial infection, viral infection, Φ

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            996
tumour in a patient, and differentiating metastatic liver cancer from hepatocellular carcinoma in a patient, involving detecting the level of expression of two or more genes represented in ABN93503-ABN97455 in a tissue sample. The method of the invention has hepatotropic, and cytostatic activity. The method is useful for diagnosing and detecting the progression of liver cancer, hepatocellular carcinoma and metastatic liver carcinoma in a patient. The method is useful for identifying expression profiles which serve as useful diagnostic markers as well as markers that can be used to monitor disease states, disease progression, error forcilly, drug efficacy and drug metabolism.

Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIDO at fip.WIDO.int/pub/published_pct_sequences.

The invention provides antisense compounds targeted to human tumour necrosis factor receptor type I (TNRR1) RNA. These antisense compounds can be used in a method of inhibiting the expression of TNRR1 human cells or tissues. The antisense compounds specifically hybridize with one or more nucleic acids encoding TNRR1 modulating the function of nucleic acid molecules encoding TNRR1 ultimately modulating the amount of TNRR1 produced. The antisense compounds and method are useful as research reagents and diagnostics, and in the treatment and prophylaxis of infection, inflammation or tumour formation. The present sequence represents the nucleotide sequence of human TNRR1 (GenBank Accn No: X55313).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            840

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  셤
                                                                                                                                                                                                                                   This invention relates to a novel method for enhanced killing of tumour cells comprising contacting a tumour cell with a synergistic cells comprising contacting a tumour cell with a synergistic combination of a death domain receptor ligand and a diterpenoid triepoxide. This method has cytostatic activity and works by blocking triepoxide. This method has cytostatic activity and works by blocking TNP-alpha mediated induction of c.IAP2 and c.IAP1. The method of the invention may be used for treating tumours, particularly solid tumours, e.g. carcinoma, mammary adenocarcinoma and non-small cell lum carcinoma also neurological malignancies, non-Wite cutaneous T-cell lymphoma, cutaneous T-cell ymphomatoid papulosis, T-cell rich cutaneous T-cell lymphoma, lymphomatoid papulosis, T-cell rich cutaneous lymphoid hyperplasis, bullous pemphigoid, discoid lupus erythematosus, lichen planus. The combination may be administered with other active agents, e.g. antimetastatic, anti-tumour or anti-angiogenic agents. The potent synergy between the diterpenoids and the death domain ligands allows increased xilling at equivalent or lower doses, and can sensitise otherwise resistant cells. This sequence represents the human tumour necrosis. factor alpha receptor (TNF-RI) DNA. TNF-RI is a death domain receptor used in the used method of the invention in combination with diterpenoid triepoxides to kill tumours by inducing apoptosis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   315

                                                                                                                                                                                                                                                                                                                                                                           Partial amino acid sequences were determined for the 55 and 75kD TNF-BPB (see AAR11072-R11081) and oligonucleotide primers were synthesised based on these partial sequences. The primers were used to produce a cDNA fragment for use as aprobe to screen a human placental cDNA bank constructed in lambda 9t11. Positive clones were identified and sequenced. DNA constructs comprising the TNF-BP coding sequence may also contain a fragment encoding a human Ig domain. Recombinant constructs are used to transform cells to confer improved TNF-binding properties.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     DB 12; Length 2111;

                                                                                                                                                                                                                                                                                  This sequence encodes human TNF-alpha 55kD receptor . A placenta CDNA library in gt10 was screened with probe AAQ29236. Ten hybridising clones were plaque purified and CDNA size determined by PAGE against an ECO RI digested phage DNA. The inserts of two CDNA clones were then sequenced. The coding region of the majority of the human TNF-alpha 55kD receptor was isolated as an ECORI fragment encoding 374 amino acids, and cloned into a mammalian cell expression vector, resulting in priNRR. A derivative of the TNF-alpha receptor was produced by engineering a termination codon just prior to the transmembrane engineering a termination codon just prior to the transmembrane restriction fragment which was cloned into priNRR, giving pINFReed. DNA sequencing confirmed this contained the designed DNA sequence.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             214

The Tumour Necrosis Factor Binding Protein I is the soluble form of type I TNF-receptor and constitutes a fragment of the cell surface form of this receptor, corresp. to its extracellular domain. There is no characteristic poly(A) addition signal near the 3' end of the cDNA. The sequence ACTAAA (tag m) may serve as an alternative to this signal, but with low efficiency. See also AAQ1212-15.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Recombinant tumour necrosis factor binding protein I - prepd. by transfecting eukaryotic cells with vector contg. deoxyribonucleic acid encoding human type I TNF receptor or soluble domain

Pred. No. is the number of results predicted by chance to have a

score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
